

*Pre-Pattern Gravitational Electromagnetism Theory Title: 'Pre-
Pattern Gravitational Electromagnetism: A Universal Structuring
Mechanism'*

*This theory introduces a unifying framework called U.N.m., describing the hidden pre-patterned structure that governs the formation of matter at both cosmic and quantum scales. The core proposition is that particles do not emerge randomly but are formed through a gravitational-electromagnetic field (Ge), possessing both positive and negative poles, and behaving like a universal funnel or containment field. Within this structure, micro-ratios ($m+/-$) represent the smallest scaling units, visible in patterned forms. The resulting equation: $U.N.m = Ge * m+/- * c * 5^2$*

serves as a candidate for a universal structuring mechanism, not derived from direct instrumentation, but decoded from hidden patterns that predate observable matter. This proposal opens a new theoretical bridge between pattern logic, field structure, and matter emergence, and suggests that gravitational-electromagnetic symmetry may underlie both fusion and formation processes, from stellar to subatomic scales. Further implications point toward a meta-structural logic of the universe, where the existence of matter is a consequence of alignment with this encoded field.
